MONTHLY SUMMARY FOR JANUARY 1997

Despite three significant snow storms and four intrusions of cold air with sub-zero temperatures, preliminary reports indicate that January was drier and warmer than normal. The average station in the state received 0.48 inches of precipitation, 0.78 inches less than normal, ranking this as the 15th driest January since 1892. The largest precipitation deficits occurred in the southeastern third of the state, but no region of the state experienced greater-than-normal precipitation. The statewide averaged temperature, inflated by unseasonal warmth during the first four days and a mild last half of the month, was 37.0 degrees, 0.6 degrees above normal but ranking only as the 65th warmest out of 106 years.

Daytime temperatures were in the 80s in much of southwestern Oklahoma during the first four days of the month. The Oklahoma Mesonet site near Arnett (Ellis County) recorded a high temperature of 85 degrees on the 2nd. National Weather Service cooperative observers at Mangum (Greer) and Hollis (Harmon) reported daytime high temperatures of 84 degrees on the 2nd and 3rd, respectively.

A cold front moved through the state on the 4th, returning temperatures to more seasonal values. A major upper-level storm system brought its influence to bear on the state from the 6th through the 10th, producing significant snowfall in many areas and, eventually, leading to significantly lower temperatures. Snowfall across the northwestern half of the state from the 6th through the 9th led to accumulations as great as 9 inches at Choctaw (Oklahoma), 7 inches at Nowata (Nowata) and Elk City (Beckham) and 6 inches at Hollis, Sweetwater (Beckham), Perkins (Payne), Claremore (Rogers) and Upper Spavinaw State Park (Delaware).

A smaller winter storm from the 10th through the 12th produced a winter mix of precipitation, mainly in the west, including 4 inches of snow at Altus (Jackson), 7 inches of snow in the Panhandle at Boise City (Cimarron) and freezing rain in other areas. Overnight low temperatures were below zero in many areas from the 11th through the 13th. Temperatures in snow-covered areas in extreme northwestern and northeastern Oklahoma never rose above 10 degrees on the 11th and 12th. Temperatures stayed below freezing throughout the state from the 11th through the 13th.

A third winter storm swept through the state on the 13th and 14th, producing as much as 6 inches of snow at Pawnee (Pawnee) and bringing freezing rain to southern and eastern regions of the state. Temperatures over the snow cover in the northeast plunged as Barnsdall (Osage) reached a low of -13 degrees, Pawhuska (Osage) dropped to -9 and Vinita (Craig) reported -7, all on the 17th.

A significant warming began in the south and west on the 17th, returning daytime temperatures to the 70s in many areas and introducing a period of milder weather that held, for the most part, through the end of the month. A push of cold air settled into northern Oklahoma on the 28th to return sub-zero overnight temperatures to a few areas, most notably Hulah Dam (Osage) which recorded a low of -11 on the 30th. Temperatures in most areas of the state had returned to the 60s and 70s statewide by the afternoon of the 31st. The Mesonet site at Burneyville (Love) recorded a high temperature of 80 degrees on the 31st.

EXPLANATION OF TABLES

Two kinds of tables appear in this summary. The first is a set of tables containing all reporting stations grouped by climate division. The figure above shows the locations of the climate divisions. Each table contains the following information for each station:

Station Name:

Station Identification Number: These are usually assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Maximum: The maximum daily maximum temperature observed during the current month and year and the day which it occurred.

Minimum Daily Minimum: The minimum daily minimum temperature observed during the current month and year and the day which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. They are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For February 1984 HDD would be calculated as:

$$\sum_{i=1}^{29} 65 - ((TMAX_i + TMIN_i) / 2)$$

Deviation from Normal Heating Degree Days: A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. They are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. For June, CDD would be calculated as:

$$\sum_{i=1}^{30} ((TMAX_i + TMIN_i) / 2) - 65$$

Deviation from Normal Cooling Degree Days: A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no-rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

The second set of tables contain similar information but are the average or extreme over all the stations reporting in each climate division.

OKLAHOMA CITY CLIMATE CALENDAR

MARCH

The data on this calendar are for Oklahoma City.
 Normal values are calculated for the period
 1961-1990. Extremes are found for the period
 of record (1891-present).
