Oklahoma Climatological Survey

MONTHLY SUMMARY FOR DECEMBER 2001

December 2001

Statewide average temperature = 42.7° F

Statewide average rainfall = 2.07 inches

Oklahoma's December statewide-averaged monthly precipitation total illustrates the occasionally misleading nature of such simplified indicators. Heavy rains in southeastern Oklahoma, where normal December precipitation typically is substantially greater than it is elsewhere in the state, offset extremely dry conditions elsewhere to provide the state with "greater-than-normal" precipitation for the month. Although four of the state's nine climate divisions each received less than half of its normal precipitation in December, the state's composite total for the month, 2.07 inches, is 0.41 inches greater than the established normal. December 2001 thus ranks as the 30th wettest December since such record keeping began in 1892.

The precipitation surplus for the month was not sufficient however, to offset the rest of a predominately dry year, leaving the state with a less-than-normal annual precipitation for the first time since 1988. This year's annual total precipitation of 31.98 inches fell 2.26 inches below the normal figure (based on 1961 through 1990 data) and ranks this as the 43rd driest of the 110 years on record. The annual deficit was established by the developing drought in western portions of the state beginning in June. From June 1 through the end of the year, the statewide-averaged precipitation totaled 15.25 inches, which is 6.31 inches less than normal and the 20th driest such period yet recorded in the state.

December Normals

Statewide average temperature = 39.5° F

Statewide average rainfall = 1.66 inches

This December was mild, despite a post-Christmas outbreak of frigid air that blanketed the state. The statewide-averaged temperature for the month, 42.7 degrees, was 3.2 degrees greater than normal and ranks this as the 28th warmest December since 1892. The mild December left the state slightly warmer-than-normal for the year, as evidenced by an annual temperature of 61.0, which, at 0.7 degree greater than normal, ranks 2001 as the 32nd warmest year on record.

The state enjoyed a solid week of mild weather at the start of the month with daily maximum temperatures in the 50s, 60s, and 70s, statewide and sub-freezing daily minimum temperatures confined to the northwest. Somewhat cooler air made it into the state during the second week. Overnight temperatures dropped below freezing over most of the state on the 9th. Boise City (Cimarron County) reported an inch of snow on the 12th and the Kenton Mesonet site (also Cimarron) recorded a 7-degree temperature on the 13th as a surge of cold air pushed through the state. The wintry surge triggered locally heavy rains when it reached the moisture-laden air of the state's southeastern corner.

(Continued on page 3.)

Localized flooding was reported on the 16th in LeFlore County along the Kiamichi, Poteau, and Black Fork rivers and in rural areas of McCurtain, Choctaw, and Pushmataha counties. Several cars were washed off of the road or simply stalled at low-water bridges. Especially notable rainfall totals from the 15th through the morning reporting time, generally 7 AM, on the 17th included (all in McCurtain County): 8.33 inches at the Mount Herman Mesonet site, 8.05 inches eight miles west of Broken Bow, 7.91 inches at Smithville, and 7.71 inches at Valliant.

After a moderating period that brought southwestern Oklahoma temperatures in the 70s on the 18th, a new blast of cold air, along with some real wintry weather appeared in the state just before Christmas. Temperatures dived into the single digits in the northwest, bottoming out at one degree above zero as reported at Fort Supply (Woodward) on the 30th and by the Seiling Mesonet site (Dewey) on the 31st. One-to-four inches of snow blanketed the western half of the state on the 30th and 31st. Retrop (Beckham) and Reydon (Roger Mills) were the lucky recipients of the 4-inch snowfalls. Less general one-to-two inch snowfalls were reported east as far as Scipio (Pittsburg) and Carter Tower (McCurtain). The snow, along with some ice accumulations, led to a spate of traffic accidents in the Oklahoma City metropolitan area and points west. Twenty-five cars were involved in a series of non-fatal accidents near Weatherford that halted traffic on Interstate 40 for several hours.

Howard L. Johnson
Associate State Climatologist

Note: The above climate division summary contains similar information to the preceding tables but are the averages or extremes over all of the stations reporting in each climate division.

CLIMATE DIVISION MAP

EXPLANATION OF TABLES

The tables appearing on the preceding pages contain the following information for each station or climate division:

Station Name: The name of the observing site.

Station Identification Number: These numbers usually are assigned by the National Climatic Data Center.

Climate Division: See the figure above.

Number of Temperature Observations: These numbers are the actual number of temperature reports recorded at the station during the current month. Missing observations may result in artificially high or low mean monthly temperatures.

Deviation from Normal: The deviation of the observed mean monthly temperature from the monthly station normal. A positive value indicates the month was warmer than normal. A negative value indicates the month was cooler than normal. Normal monthly temperatures may be calculated by subtracting the deviation from the observed temperature.

Maximum Daily Temperature: The maximum daily maximum temperature observed during the current month and year and the day on which it occurred.

Minimum Daily Temperature: The minimum daily minimum temperature observed during the current month and year and the day on which it occurred.

Heating Degree Days: HDD are calculated each day of the month for which there is a temperature report and the average temperature for the day is less than 65 degrees. Daily values are summed to arrive at a monthly total. HDD are a qualitative measure of how much heat was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. See the equation to the right for the HDD calculation.

Deviation from Normal Heating Degree Days: The difference between the actual HDD and the normal HDD for the month. A positive value indicates higher than normal heating requirements for the month as a whole. A negative value indicates lower than normal heating requirements for the month as a whole. Normal HDD may be calculated by subtracting the deviation from observed HDD.

Cooling Degree Days: CDD are calculated each day of the month for which there is a temperature report and the average temperature for the day exceeds 65 degrees. Daily values are summed to give a monthly total. CDD are a proxy measure of how much cooling was required to maintain a comfortable indoor temperature. Missing observations may result in an artificially high or low value. See the equation to the right for the CDD calculation.

Deviation from Normal Cooling Degree Days: The difference between the actual HDD and the normal HDD for the month. A positive value indicates higher than normal cooling requirements for the month as a whole. A negative value indicates lower than normal cooling requirements for the month as a whole. Normal cooling degree days may be found by subtracting the deviation from the observed cooling degree days.

Total Precipitation: Often incorrectly referred to as a mean precipitation, this value is the sum of all precipitation reported during the month at a station. If snow occurred, it is to be melted and its water equivalent recorded.

Number of Precipitation Observations: The number of days a rain or no rain observation was reported. Missing observations frequently result in artificially low total precipitation values.

Deviation from Normal Precipitation: The difference between the actual rainfall and the normal rainfall for the month. A positive value indicates more rain than normal was received. A negative value indicates less than was expected rainfall was received. Normal rainfall may be calculated by subtracting the deviation from the monthly total.

Maximum 24-Hour Report and Day: The maximum amount of precipitation recorded during the station's 24-hour observation period for the current month and year and the day on which it was recorded.

Heating Degree Days Calculation

NumDays

$$\sum_{i=1}^{NumDays} 65 - ((TMAX_i + TMIN_i) / 2)$$

Where NumDays = the number of days in the month of interest (e.g., NumDays = 31 for January)

Cooling Degree Days Calculation

NumDays

$$\sum_{i=1}^{NumDays} ((TMAX_i + TMIN_i) / 2) - 65$$

Where NumDays = the number of days in the month of interest (e.g., NumDays = 30 for June)
